

With 1 in 7 adults living with diabetes, Spain has second highest diabetes prevalence in Europe

New figures released by the International Diabetes Federation show that over 5 million adults in the country are affected by the condition.

Spain has seen a 42% increase in the number of people with diabetes in two years

Diabetes-related health expenditure in Spain is 15.5 billion USD, ninth highest in the world

12 November, 2021 – Ahead of World Diabetes Day, the International Diabetes Federation (IDF) has released new figures showing that 537 million adults are now living with diabetes worldwide — a rise of 16% (74 million) since the previous IDF estimates in 2019. These findings from the 10th Edition of the IDF Diabetes Atlas, which will be published on December 6th, report that 5.1 million adults in Spain are living with diabetes – a 42% increase in of the number of people with diabetes since 2019.

The diabetes prevalence in Spain has reached 14.8%, or one in seven adults, the second highest rate in Europe. In addition, the diabetes-related health expenditure in Spain has reached 15.5 billion USD, putting them in the top ten list of countries in terms of diabetes-related health expenditure.

Almost a third (30.3%) of people living with diabetes in Spain are undiagnosed. When diabetes is undetected or inadequately treated, it can cause serious and life-threatening complications, such as heart attack, stroke, kidney failure, blindness and lower-limb amputation. These result in reduced quality of life and higher healthcare costs.

“The past two years have shown a sharp increase in the number of adults living with diabetes in Spain. This is a worrying trend, impacting the lives of millions across the country,” says Dr Antonio Pérez Pérez, President, Spanish Diabetes Association (SED) and Director at the Department of Endocrinology and Nutrition, Hospital de la Santa Creu i Sant Pau de Barcelona.

This year marks 100 years since the discovery of insulin. That milestone presents a unique opportunity to reflect on the numbers of people living with diabetes, as well as the urgent need to improve access to care for the millions affected.

“We must do more to provide affordable and uninterrupted access to diabetes care for all people who require it in Spain, and around the world. Policy makers and health decision-makers must turn words into action to improve the lives of people with diabetes and prevent the condition in those at high risk of developing it,” continues Pérez.

Globally, 90% of people with diabetes have type 2 diabetes. The rise in the number of people with type 2 diabetes is driven by a complex interplay of socio-economic, demographic, environmental and genetic factors. Key contributors include urbanisation, an ageing population, decreasing levels of physical activity and increasing levels of people being overweight and developing obesity.

Much can be done to reduce the impact of diabetes. Evidence suggests that type 2 diabetes can often be prevented, while early diagnosis and access to appropriate care for all types of diabetes can avoid or delay complications in people living with the condition.

Key global and regional findings from the IDF Diabetes Atlas 10th Edition include:

- One in ten adults (537 million) around the world are currently living with diabetes. The total number is predicted to rise to 643 million (11.3%) by 2030 and to 783 million (12.2%) by 2045.

- One in eleven adults (61 million) in Europe are living with diabetes.
- An estimated 240 million people are living with undiagnosed diabetes worldwide – 22 million in Europe.
- Diabetes was responsible for an estimated USD 966 billion in global health expenditure in 2021. This represents a 316% increase over 15 years. Europe accounts for 20% (189 billion USD) of the global expenditure.
- Excluding the mortality risks associated with the COVID-19 pandemic, approximately 6.7 million adults are estimated to have died as a result of diabetes, or its complications, in 2021. That's more than one in ten (12.2%) of global deaths from all causes. The Europe Region accounts for 2% (111,000) of total diabetes-related deaths.
- 541 million adults, or 10.6% of adults worldwide, have impaired glucose tolerance (IGT), placing them at high risk of developing type 2 diabetes. Over one in ten (55 million) people affected by IGT live in the Europe Region.
- Europe has the largest number of children and adolescents with type 1 diabetes – 295,000

More information and supporting data about the national, regional and global prevalence of diabetes from the 10th Edition of the IDF Diabetes Atlas can be found at www.diabetesatlas.org.

The theme of World Diabetes Day this 14 November is **Access to Diabetes Care**. IDF is calling on national governments to provide the best possible care for people living with diabetes and develop policies to improve diabetes screening and type 2 diabetes prevention, especially among young people. About the IDF Diabetes Atlas

The IDF Diabetes Atlas is an authoritative resource on the global impact of diabetes. First published in 2000, it is updated periodically by IDF in collaboration with experts from around the world and contains data on diabetes prevalence, mortality and expenditure on global, regional and national levels. The IDF Diabetes Atlas draws attention to the importance and growing impact of diabetes in all countries and IDF Regions. www.diabetesatlas.org

About the International Diabetes Federation

The International Diabetes Federation (IDF) is an umbrella organisation of over 230 national diabetes associations in 170 countries and territories. It represents the interests of the growing number of people with diabetes and those at risk. The Federation has been leading the global diabetes community since 1950. www.idf.org

About World Diabetes Day

World Diabetes Day was created in 1991 by IDF and the World Health Organization in response to growing concerns about the escalating health threat posed by diabetes. World Diabetes Day became an official United Nations Day in 2006 with the passage of United Nation Resolution 61/225. It is marked every year on 14 November, the birthday of Sir Frederick Banting, who co-discovered insulin along with Charles Best in 1921. The World Diabetes Day 2021 campaign is supported by Allergan, AstraZeneca, Gan & Lee, Lilly Diabetes, Merck, Novo Nordisk, Pfizer/MSD Alliance and Sanofi.
